About the Author.....	338

## AUTHOR'S FOREWORD

The 1939 novel, "Gadsby," contains more than 50,000 words. The unusual thing about the book is that it's written without the letter, "e." The novel is a lipogram, a form of constrained writing in which certain letters are avoided.

I'm sure everyone has seen a coffee mug with the word, "caffeine," spelled with chemical elements as 

Ca	F	Fe	I	Ne
----	---	----	---	----

. If you're not a coffee drinker, you can find a tee-shirt emblazoned with a similar transliteration for chocolate, 

C	Ho	Co	La	Te
---	----	----	----	----

The symbols for the elements in the periodic table are the chemist's alphabet. Nearly every chemist can name the element associated with each symbol, except for the fleeting radioactive elements that occur at high atomic number. By my count, I've used 76 of the 118 elements in various studies. This number is larger than most, since my specialty was the Rare Earth elements.

It's not possible to spell every word using chemical elements. Notably, there are no "J" or "Q" elements, so all "J" and "Q" words are out. The only two "Z" elements are zinc (Zn) and zirconium (Zr); however, no words in the English language start with zn or zr, so all "Z" words are out.

The Webster's Unabridged Dictionary ("Webster's Second") was first published in 1913, and it is now in the public domain. This massive volume was well loved by linguists, so much so that there was much criticism when its replacement ("Webster's Third") was issued in 1961. I subjected the text file of the Project Gutenberg version of Webster's Unabridged Dictionary to extensive computer processing to find all the words therein that could be spelled with the chemical elements.

In order to properly render these "chemical words," I created the Periodic Table type font you see in this book.

Special thanks to my daughter and son-in-law for catching some errors in the text. Any errors that might remain are my fault, alone!
